@deftypefn {Function File} {@var{status} =} shapewrite (@var{shpstr}, @var{fname})

Write contents of map- or geostruct to a GIS shape file.

@var{shpstr} must be a valid mapstruct or geostruct, a struct array with an entry for each shape feature, with fields Geometry, BoundingBox, and X and Y (mapstruct) or Lat and Lon (geostruct). For geostructs, Lat and Lon field data will be written as X and Y data. Field Geometry can have data values of 'Point', 'MultiPoint', 'Line', or 'Polygon', all case-insensitive. For

each shape feature, field BoundingBox should contain the minimum and maximum (X,Y) coordinates in a 2x2 array [minX, minY; maxX, maxY]. The X and Y fields should contain X (or Latitude) and Y (or Longitude) coordinates for each point or vertex as row vectors; for polylines and polygons vertices of each subfeature (if present) should be separated by NaN entries.

@var{fname} should be a valid shape file name, optionally with a '.shp' suffix.

shapewrite produces 2 or 3 files, i.e. a .shp file (the actual shape file), a .shx file (index file), and if @var{shpstr} contained additional fields, a .dbf file (dBase type 3) with the contents of those additional fields.

@var{status} is 1 if the shape file set was written successfully, 0 otherwise.

@seealso{shaperead, shapeinfo}
 @end deftypefn
 Author: Philip Nienhuis <prnienhuis@users.sf.net>
 Created: 2014-12-30
 Input validation
 Assess shape variable type (oct or ml/geo ml/map)
 Yep. Find out what type
 Assume it is an Octave-style struct read by shaperead
 Assume it is a Matlab-style mapstruct
 Assume it is a Matlab-style geostruct
 Not a supported struct type
 Check file name
 Later on bname.shx and bname.dbf will be read
 Prepare a few things
 Change Lat/Lon fields into X/Y
 Only now (after input checks) open .shp and .shx files & rewind just to be sure
 Write headers in .shp & .shx (identical). First magic number 9994 + 5 zeros
 In between here = filelength in 16-bit words (single). For .shx it's known
 Next, shp file version
 Shape feature type
 Bounding box. Can be run later for ML type shape structs. Fill with zeros

```

Skip to start of first record position
Write shape features one by one
Write record start pos to .shx file
Write record contents
Point
Record index number
Record length (fixed)
Shape type
Simply write XY coordinates
MultiPoint
Record index number
Record length
Shape type
Bounding box
Nr of points
Polyline/-gon
Record index number
Prepare multipart polygons
Augment idx for later on, & this trick eliminates trailing NaN rows
Record length
Shape type
Bounding box
Number of parts, number of points, part pointers
Write file length into .shp header
Close files
Check for dbfwrite function
Write rest of attributes
Attributes + shp data in mapstruct
Attributes + shp data in geostruct

```
